

PI Zone Valve, 2-way, Internal thread

- For closed cold and warm water systems
- For modulating control of air-handling and heating systems on the water side
- Snap-assembly of the actuator

Materials

Terms

Fluid	Cold and warm water, water with glycol up to max. 50% vol.						
Fluid temperature	-20120°C						
Fluid temperature note	with actuator 290°C						
Differential pressure	16 kPa350 kPa						
Close-off pressure ∆ps	1400 kPa						
Flow characteristic	equal percentage (VDI/VDE 2178), optimised in the opening range						
Pressure stability	±5% with a pressure value of 35350 kPa ±10% with a pressure value of 1635 kPa						
Leakage rate	air-bubble tight, leakage rate A (EN 12266-1)						
Flow setting	See installation instruction						
Angle of rotation	90°						
Angle of rotation note	Operating range 1590°						
Pipe connection	Internal thread according to ISO 7-1						
Installation position	upright to horizontal (in relation to the stem)						
Servicing	maintenance-free						
Valve body	Brass						
Closing element	Stainless steel						
Stem	Stainless steel						
Stem seal	EPDM O-ring						
Seat	PTFE, O-ring EPDM						
Diaphragm	EPDM						
Abbreviations	V'nom = nominal flow with valve completely opened V'max = maximum flow, set by the angle of rotation limitation on the actuator Sv = Rangebility kvs/kvr						

Safety notes

- The valve has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.
- Only authorised specialists may carry out installation. All applicable legal or institutional installation regulations must be complied during installation.
- The valve does not contain any parts that can be replaced or repaired by the user.
- The valve may not be disposed of as household refuse. All locally valid regulations and requirements must be observed.
- When determining the flow rate characteristic of controlled devices, the recognised directives must be observed.

Product features

Mode of operation

The ball valve is adjusted by a rotary actuator. The actuator is controlled by a commercially available modulating or 3-point control system and moves the ball of the valve – the throttling device – to the position dictated by the positioning signal. Open the characterised control valve counterclockwise and close it clockwise.

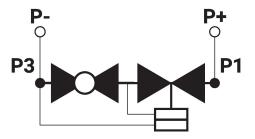

Flow characteristic

Equal percentage flow control is ensured by the special design of the ball.

Constant flow volume

With a differential pressure of 16...350 kPa, a constant flow volume is achieved thanks to the integrated pressure regulating valve. Independently of the differential pressure through the valve, a valve authority of 1 is achieved. Even with pressure variations and in the partial load range, the flow rate remains constant with each respective opening position (angle of rotation) and ensures a steady control.

Pressure at valve inlet P1 Pressure at valve outlet P3 Measuring point at measuring port (Inlet red marking) P+ Measuring point at measuring port (Outlet blue marking) P-

Flow limitation

Instead of the electric actuator, the PIQCV-valve can also be operated with a flow limiter (see accessories).

The flow limiter ensures that the heat exchanger is continuously supplied with a manually fixed amount of water.

Measuring ports (P/T ports)

The C2..QPT-.. type valves have two measurement ports. The total drop in pressure across the valve can be determined using the measurement points at the valve inlet (P1) and outlet (P3).

The measurement ports can be used to easily establish whether the actual differential pressure across the valve is within the admissible range of 16...350 kPa. If it is, the valve operates independently of pressure and the correct flow rate is automatically ensured by the valve according to the setting table.

The differential pressure measurement can also be used to optimise the pump setting. This involves reducing the pump head until only the minimum differential pressure required (16 kPa) is still present across the valve at the point of lowest pressure (the furthest away from the pump in hydronic terms).

Installation notes

Recommended installation positions

The ball valve can be installed upright to horizontal. The ball valve may not be installed in a hanging position, i.e. with the spindle pointing downwards.

Installation in return

Installation in the return is recommended.

Water quality requirements

The water quality requirements specified in VDI 2035 must be adhered to.

Belimo valves are regulating devices. For the valves to function correctly in the long term, they must be kept free from particle debris (e.g. welding beads during installation work). The installation of a suitable strainer is recommended.

Servicing

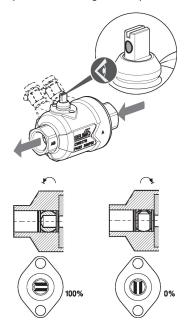

Ball valves and rotary actuators are maintenance-free.

Before any service work on the final controlling device is carried out, it is essential to isolate the rotary actuator from the power supply (by unplugging the electrical cable if necessary). Any pumps in the part of the piping system concerned must also be switched off and the appropriate slide valves closed (allow all components to cool down first if necessary and always reduce the system pressure to ambient pressure level).

The system must not be returned to service until the ball valve and the rotary actuator have been correctly reassembled in accordance with the instructions and the pipeline has been refilled by professionally trained personnel.

Flow direction

The direction of flow, specified by an arrow on the housing, is to be complied with, since otherwise the ball valve could become damaged. Please ensure that the ball is in the correct position (marking on the spindle).

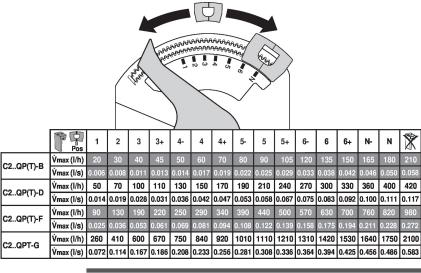

Flow setting

The angle of rotation of the CQ.. actuator can be changed by end stop clip in 2.5° increments. This is used to set the V'max-value (maximum flow rate of the valve).

Remove end stop clip and place at desired position.

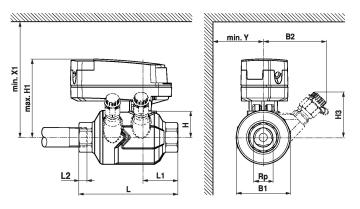

After every change of the flow setting by means of end stop clip, an adaptation must be triggered on the modulating actuators.
